Washington University Center for Health Economics and Policy

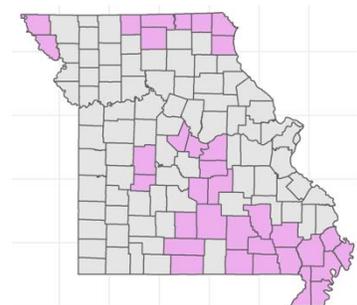

## Introduction

Three Medicaid managed care organizations (MCOs)—Healthy Blue, Home State Health, and UnitedHealthcare—serve Medicaid beneficiaries across Missouri. To assure that enrollees have adequate access to in-network providers, Medicaid MCO contracts and state regulations require that each health plan have geographically accessible in-network hospital service. Basic hospital services, such as an emergency department, should be available to enrollees within 30 miles; secondary hospital services within 50 miles; and Trauma I/II, neonatal intensive care, and other highly specialized tertiary hospital services within 100 miles.

However, all 3 Medicaid MCOs report being unable to offer networks that meet hospital travel distance standards in significant, often contiguous swaths of the state. One fundamental problem is a shortage of hospitals offering basic and tertiary services in some communities. Another problem with a more readily available remedy is that certain hospitals do not contract with one or more Medicaid MCOs. In either case, when Medicaid MCOs cannot meet network standards, Medicaid enrollees are forced to travel longer distances to access care.

## Key Findings

- Medicaid MCOs report widespread shortages of in-network hospitals.
  - In 34 Missouri counties - almost 3 in 10 counties in the state - at least one Medicaid MCO does not meet hospital network travel distance standards for 1 or more types of hospital services.
- In 26 counties, network shortages are caused by a lack of hospitals offering basic and specialized tertiary services, especially in rural parts of the state.
  - The lack of hospital services is most severe for level I/II trauma services. In 12 counties in southeast Missouri, MCOs cannot meet network adequacy standards because no hospitals within 100 miles have level I/II emergency trauma services.
  - In 11 counties, MCOs cannot meet network adequacy standards because of a shortage of hospitals offering basic hospital services, like an emergency department, within 30 miles. More than half of these counties had hospitals close in the last few years.
- In 17 counties, network shortages result from hospitals refusing to join—or being excluded from—Medicaid MCO networks. These network gaps could be closed if managed care companies brought more hospitals into their networks.
  - As of March 1, 2021, 25 hospitals, almost 1 in 4 Missouri hospitals, were out-of-network for at least one Medicaid managed care plan.
  - By July 2021, the number of hospitals out-of-network for one or more Medicaid MCOs doubled, rising to 49, almost half of hospitals (45%) across the state.

## Missouri Medicaid MCO Network Adequacy Standards

Three Medicaid managed care organizations (MCOs)—Healthy Blue, Home State Health, and UnitedHealthcare—serve almost 800,000 Medicaid beneficiaries across the state. With Medicaid expansion, that number likely will rise to over one million enrollees within the next year.

Medicaid managed care enrollees generally must use health facilities and professionals that have contracted with their managed care plan and are thus "in-network." To assure a baseline level of access to Medicaid services, federal Medicaid regulations require states to develop, publish, and monitor quantitative managed care network adequacy standards for 11 categories of providers, including hospitals, pharmacies, and primary and specialty care professionals.

In Missouri, Medicaid managed care contracts between the state and the managed care companies specify the quantitative network adequacy standards that managed care plans must meet. These include travel distance standards (miles traveled by road), appointment time standards, and special requirements for home health, school-based dental services, FQHCs, and Community Mental Health Centers. The contracts stress that Medicaid networks should be geographically accessible and include a "broad range of providers."

The managed care contracts require Medicaid MCOs to comply with travel distance standards for 8 types of hospital services set forth in Missouri regulations that apply to all HMOs in the state. These standards require that basic hospital services, like an emergency department and general medical care for all ages, should be available within 30 miles by road; secondary hospitals within 50 miles; and Trauma I/II emergency care, neonatal intensive care, and other tertiary hospital services within 100 miles. Table I describes each type of hospital service outlined in state regulations.

Network adequacy standards specify that at least 90% of enrollees in each county should have access to at least 1 in-network hospital within the travel distance standard. The state will grant a "noncompetitive market exception" to this 90% requirement when no hospital is available within the distance standard and the managed care plan contracts with a hospital no more than 25 miles further than the hospital closest to the county. The state also grants exceptions when an available provider within the distance standard will not contract with the managed care plan, but the plan contracts with a provider no more than 25 miles beyond the distance standard.

## How We Used Data from Medicaid Managed Care Plans Annual Network Access Plans

This data comes from the annual Network Access Plans filed by the 3 Medicaid managed care plans on March 1, 2021. Each MCO submits a list of enrollees by zip code and a list of in-network facilities and health professionals by address. Each MCO also submits an analysis of its network that identifies any county-level gaps and requests for exceptions. MO HealthNet uses geo-mapping software to evaluate the information submitted by each MCO by county to determine if the managed care plan has sufficient providers to meet network travel distance standards and whether to grant exemption requests.

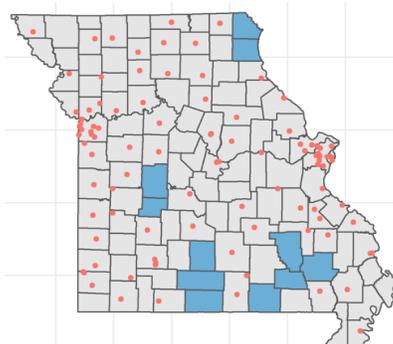

By reviewing the annual Network Access Plan data submitted by the MCOs and the correspondence between MO HealthNet and the MCOs, we identified the counties where Medicaid managed care plans failed to meet travel distance standards for in-network hospitals, including counties where the state granted MCO requests for exceptions. Our analysis for United Healthcare is incomplete because the company objected to the state disclosing its network analysis and correspondence with MO HealthNet. We have United HealthCare's list of its in-network hospitals, which allows us to conclude where hospital shortages impact MCOs' ability to meet network adequacy standards. We are unable to identify network adequacy gaps for 2021 that are specific to United HealthCare.

## Hospital Shortages Mean that Medicaid MCOs Can't Meet Network Standards

A lack of hospitals, particularly in northeast and southern Missouri, means that Medicaid MCOs are unable to comply with hospital network travel distance standards. Rural hospital closures in recent years have exacerbated the problem.

### Basic Hospital Services

In 11 counties, a lack of hospitals means that no Medicaid MCO meets the 30-mile travel distance standard for basic hospitals. These counties are clustered in the rural south, central, and the far northeast corner of the state.

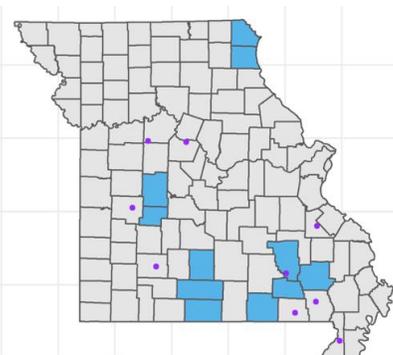

Counties with no basic hospitals within 30 travel miles

- |   |          |         |
|---|----------|---------|
| ■ | Benton   | Carter  |
|   | Clark    | Douglas |
|   | Hickory  | Lewis   |
|   | Oregon   | Ozark   |
|   | Reynolds | Wayne   |
|   | Wright   |         |

● Basic Hospitals in MO, 2021 (104 total)

More than half of the counties without basic hospital services within 30 miles lost a nearby hospital in the last few years, as shown in the following map. For example, two rural hospitals that closed in south Missouri, Southeast Health Center of Reynolds County (2016) and Southeast Health Center of Ripley County (2018), served four rural counties. Now, Reynolds, Wayne, Carter, and Oregon, have no basic hospital services within 30 miles. Sac Osage Hospital in St. Clair County, which closed in 2014, provided basic hospital services to nearby Benton and Hickory counties in west-central Missouri.

Counties with no basic hospitals within 30 travel miles

- |   |          |         |
|---|----------|---------|
| ■ | Benton   | Carter  |
|   | Clark    | Douglas |
|   | Hickory  | Lewis   |
|   | Oregon   | Ozark   |
|   | Reynolds | Wayne   |
|   | Wright   |         |

● MO Hospital closures, 2014-2021

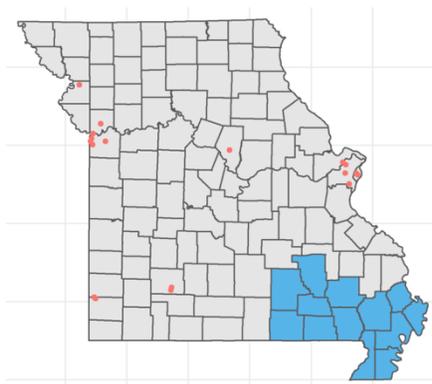

## Secondary Hospital Services

Only one county in the state, Reynolds, lacks a secondary hospital within 50 travel miles. This is some good news because it means that the other 10 counties that do not have basic hospital services within 30 miles can at least access secondary hospital services, including an emergency room, within 50 travel miles.

However, Reynolds County enrollees do not have access to either basic or secondary hospital services within the travel distance standards. Since Southeast Health Center of Reynolds County closed in 2016, county residents must travel almost 70 miles and over an hour to reach the nearest emergency department in Poplar Bluff.

## Level I or II Trauma Care

Missouri's biggest hospital distance shortage results from the lack of hospitals offering level I or II trauma care. Twelve counties in the Bootheel area do not have access to a level I or II trauma emergency department within 100 miles. Medicaid MCOs cannot meet travel distance standards for level I/II trauma services because only 18 hospitals in Missouri are designated as level I/II trauma hospitals. No hospital south of St. Louis or east of Springfield provides level 1 or II trauma services. Nearby hospitals in Arkansas or Tennessee also lack level I or II trauma services.

Counties with no level I or II hospital trauma emergency departments within 100 travel miles

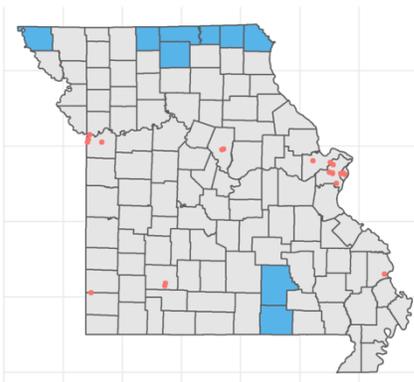

Butler	Carter
Dunklin	Mississippi
New Madrid	Oregon
Pemiscot	Ripley
Scott	Shannon
Stoddard	Wayne

● Trauma I/II Hospitals in MO (18 total)

## Perinatology, Pediatric Subspecialty, and NICU Hospital Services

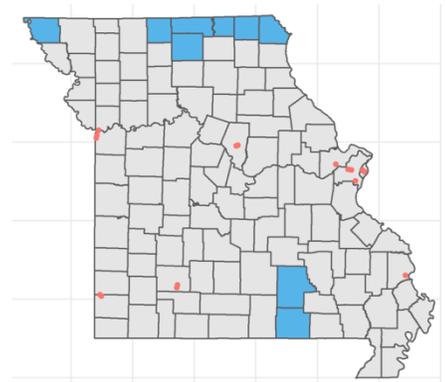

Nine counties lack tertiary obstetric and pediatric hospital services provided by highly specialized providers, and 6 of these counties also lack a neonatal intensive care unit (NICU) within the 100-mile travel distance standard. While 21 Missouri hospitals offer perinatology services, 16 provide pediatric subspecialty care, and 25 have NICUs, these hospitals tend to be clustered in the same parts of the state, leaving counties in the far north and south without services within 100 miles.

Seven counties on the Iowa border and 2 just west of the Bootheel have no perinatology or pediatric subspecialty hospital services within 100 miles, meaning that Medicaid MCOs cannot meet network adequacy standards for these types of critical, highly specialized hospital care.

Counties with no perinatology or pediatric subspecialty hospital services within 100 miles

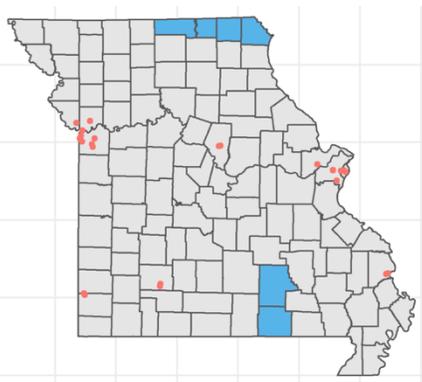

■	Atchison	Clark
	Mercer	Oregon
	Putnam	Schuyler
	Scotland	Shannon
	Sullivan	

- Perinatology hospitals in MO (21 total)

- Pediatric Subspecialty Hospital Services In MO (16 total)

Six of these 9 counties also do not have access to a NICU within 100 miles.

Counties with no NICU hospital services within 100 miles

■	Clark	Oregon
	Putnam	Schuyler
	Scotland	Shannon
●	NICU hospital services in MO (25 total)	

Counties in the Bootheel have better access to obstetric, neonatal, and pediatric tertiary hospital services than they do trauma I/II emergency services because both Southeast Hospital and Saint Francis Medical Center in Cape Girardeau offer these services. Neither hospital has a trauma I/II emergency department.

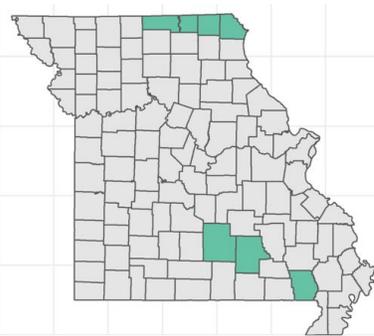

# MCOs' Failure to Contract with all Available Hospitals Creates Hospital Network Gaps that They Could Fill If More Hospitals are Brought into Managed Care Networks

When some MCOs can meet hospital network travel distance standards in a county and others cannot, the problem is likely not a lack of hospitals but an MCO's failure to contract with an available hospital to participate in their network. At least 17 counties have an MCO hospital network shortfall that may result from this kind of contracting problem. Healthy Blue fails to meet network adequacy standards in 7 counties. Home State falls short in 10 counties. However, the number of counties with these kinds of shortfalls is likely higher because United Healthcare blocked disclosure of the sections of their 2021 Access Plan that would enable us to analyze where and how their network shortfalls differ from the other two Medicaid MCOs.

To illustrate, Healthy Blue does not have Trauma I/II hospital services within the 100-mile travel distance standard in the four northeastern counties of Putnam, Schuyler, Scotland, and Clark. However, Home State Health meets Trauma I/II network adequacy standards in these counties by contracting with Blessing Memorial Hospital in Quincy, Illinois, which is within 100 miles of all 4 counties. Healthy Blue could close its Trauma I/II network gap by also contracting with Blessing Memorial.

Healthy Blue Network Shortfalls because of failure to bring hospitals in-network

- Basic hospital - Texas, Butler
- Secondary hospital - Shannon
- Trauma I/II- Putnam, Schuyler, Scotland, Clark

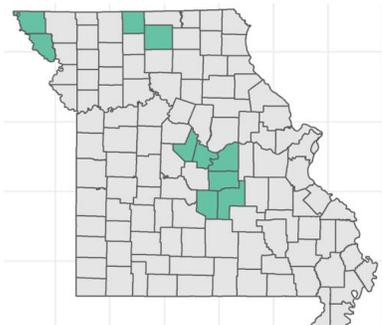

Similarly, in south-central Missouri, Healthy Blue does not have basic hospital services within 30 travel miles for enrollees in Texas county or secondary hospital services within 50 miles in Shannon County. Unlike Home State Health, it does not contract with Texas Memorial Hospital in Texas County. The same is true in Butler County, where Healthy Blue does not contract with Poplar Bluff Regional Medical Center, the county's only hospital.

Home State Health also has problems contracting with certain hospitals. Home State does not contract with three hospitals in mid-Missouri: Phelps Health (Phelps County), University of Missouri Health Care (Boone County), and Capital Regional Medical Center (Cole County). As a result, Home State falls short on having in-network access to trauma I/II services within 100 miles in two counties in mid-Missouri, Moniteau, and Cole. This lack of contracting also means that Home State does not meet the 30-mile travel standard for in-network basic hospital services in Osage, Maries, Pulaski, and Phelps counties.

Home State Network Shortfalls because of failure to bring hospitals into network

- Basic hospital - Holt, Maries, Osage, Phelps, Pulaska
- Level I/II Trauma - Cole, Moniteau
- NICU- Atchison, Mercer, Sullivan

University of Missouri Healthcare (Boone County) and Capital Regional Medical Center (Cole County) were also out of network for United Healthcare. We do not have access to United Healthcare's network analysis or the state's correspondence with UHC about its network adequacy. However, these 2 out-of-network hospitals likely create similar network gaps for United Healthcare in some mid-Missouri counties for trauma I/II services and possibly for basic hospital care.

When 1 (or 2) of 3 Medicaid MCOs fail to meet network travel distance standards because they do not contract with an available hospital, it negatively impacts Medicaid enrollees and safety-net hospitals. When a hospital is out-of-network for a Medicaid MCO, it signals that physicians employed by that hospital may also be out-of-network. When some hospitals offering basic services and others offering tertiary care provided by highly specialized providers are out of network for 1 or 2 plans, it becomes increasingly difficult for enrollees to figure out which plan best meets their needs during plan enrollment. It also creates challenges for enrollees to figure out where they should go when they need medical care. MO HealthNet stresses that enrollees can get authorization to use out-of-network hospitals at no extra cost and that hospitals cannot turn away patients in an emergency. However, low-income Medicaid enrollees may not understand how to navigate prior authorization systems.

Excluding hospitals from Medicaid managed care networks also threatens the hospital safety net. With Medicaid expansion, Medicaid managed care will likely cover over a million adults and children in Missouri by 2022. Hospitals that are not part of every Medicaid managed care network lose Medicaid patients and Medicaid reimbursement.

## More Hospitals Are Falling Out of Medicaid Managed Care Networks

Our research shows that the number of Missouri hospitals out-of-network for one or more Medicaid MCOs doubled in four months. The week of July 22, 2021, we reviewed each Medicaid MCO's online provider directory to determine whether they had brought additional hospitals into their networks since filing their Annual Network Access plan in March 2021. While some hospitals that were out-of-network in March had come in-network, we found that even more hospitals had left networks.

In March 2021, when Medicaid managed care plans filed their Annual Network Access Plans, 25 hospitals—almost 1 in 4—were out-of-network for one or more MCOs. Healthy Blue reported 21 hospitals out-of-network, Home State reported 5, and United Health Care reported 4 hospitals out-of-network.

As of July 22, 2021, according to the plans' online provider directories, 49 hospitals—almost half of the hospitals in the state— are out-of-network for at least one Medicaid managed care plan. For Healthy Blue, 40 were out-of-network, a third more than reported in their March 2021 Annual Access Plan. Seven hospitals that were out-of-network when Healthy Blue filed its Annual Network Access Plan in March had come into the network by July. However, 32 hospitals were no longer in-network.

Home State had 13 hospitals out-of-network on July 22, 2021, double the number they reported in their March 2021 annual report. The 5 hospitals they reported out-of-network in their Annual Report remained out-of-network, and 8 additional hospitals were no longer in-network.

United Health Care had 8 hospitals out-of-network in the online provider directory on July 22, 2012. This is double the number they reported in their annual report.

The large number of out-of-network hospitals reported by provider directories in July 2021 creates access problems for high-tech, subspecialty tertiary services used by patients across the state. Two of the state's children's hospitals were out-of-network: Women and Children's Hospital in Columbia was out of network for Home State and Healthy Blue. Saint Louis Children's Hospital was out-of-network for Healthy Blue. Three of the state's academic medical centers were out-of-network for one or more Medicaid MCOs. BJC was out-of-network for Healthy Blue. SSM Saint Louis University Hospital was out-of-network for Home State. University of Missouri Health Care remained out-of-network for Home State. Even though UnitedHealthcare's provider directory reported that the University of Missouri was in their network, the hospital told enrollment counselors the hospital remained out-of-network.

The increase in out-of-network hospitals also creates access problems in far-flung rural areas. Several rural hospitals that were out-of-network for *both* Healthy Blue and Home State are located in counties far enough away from other hospitals. The failure to bring these hospitals in-network likely creates additional counties with network shortfalls. These rural hospitals include:

- Harrison County Community Hospital, Putnam County Memorial Hospital, and Sullivan County Hospital located in 3 rural counties clustered together in north-central Missouri near the Iowa border.
- Wright Memorial Hospital in Wright County, just east of Texas County where Texas County Memorial Hospital was still out of network for Healthy Blue.

Many of the hospitals out-of-network for Healthy Blue in July 2021 were hospitals affiliated with some of the state's larger hospital systems, including BJC, Mercy, SSM, and Cox. Table 4 provides details about the network status for all 108 hospitals in Missouri.

## Recommendations

Medicaid MCO contracts and state regulations require each Medicaid MCO to have in-network basic hospital services, including an emergency room within 30 miles; secondary hospitals within 50 miles; and highly specialized tertiary services, like trauma I/II and NICUs, within 100 miles. However, all 3 Medicaid MCOS are unable to offer networks that meet these long-standing travel distance standards in many counties in Missouri. Failure to meet those standards is problematic for patients and the hospital safety net. One key problem is a shortage of hospitals in Missouri offering basic and tertiary services. Another problem with a more readily available remedy is that MCOs fail to bring available hospitals into their Medicaid networks.

- The significant increase in out-of-network hospitals reported from March 2021 to July 2021 creates difficulties, confusion, and uncertainty for plan enrollees. MO HealthNet, in its oversight role, should investigate why MCOs are experiencing this hospital churn and whether plan provider directories are accurate and up-to-date. Whatever the cause, MO HealthNet should work with plans to bring and keep hospitals in Medicaid managed care networks. Broad Medicaid MCO networks are good for patients and the state's safety-net hospitals.
- MO HealthNet should also work with Medicaid managed care plans to identify which network adequacy gaps are short-term contracting problems that can be resolved by bringing available providers into managed care networks. Some state Medicaid agencies give their managed care plans a few months to develop a strategy and correct short-term network adequacy gaps that arise when managed care plans are unable to bring providers into their Medicaid networks.
- MO HealthNet needs additional staff, IT, and other resources to provide effective oversight of Medicaid managed care network adequacy standards and other requirements. Both the 2019 McKinsey Report on Medicaid transformation in Missouri and the 2020 External Quality Review of Missouri Medicaid managed care recommended additional oversight activities by MO HealthNet of Medicaid MCOs.
- The state needs to develop a long-term plan for assuring that all residents, including the anticipated 275,000 newly eligible Medicaid managed care enrollees, have timely and adequate access to basic, secondary, and specialized tertiary hospital services, including emergency departments. This may entail designating new types of hospitals or emergency service providers. It requires investing in initiatives to expand the healthcare workforce and attract medical professionals to areas that have network adequacy gaps. It also requires using available technologies, like telehealth.
